

## Course Introduction

CS 537 – Fall 2017  
Operating Systems  
Michael Swift

## Today's agenda

- Administrivia
  - course overview
    - course staff
    - general structure
- What is an operating system?
- History

## Course overview

- Everything you need to know will be on the course web page:

<http://www.cs.wisc.edu/~cs537-1>

- Schedule
- Readings
- Homework
- Writings
- Projects

9/7/17

© 2004-2007 Ed Lazowska, Hank Levy, Andrea and Remzi  
Arpaci-Dusseau, Michael Swift

3

## Course Staff

- Instructor
  - Mike Swift
- TAs:
  - Yunang Chen
  - Guohong Yang
  - Sripradha Karkala
  - Aribhit Mishra
  - Viswesh Periyasamy

9/7/17

© 2004-2007 Ed Lazowska, Hank Levy, Andrea and Remzi  
Arpaci-Dusseau, Michael Swift

4

## Course Structure

- Lectures do introduce material
- Text book readings help further understanding for assignments
- Homework to practice material
- sections will focus on C programming and projects
  
- we really want to encourage *discussion*, both in class and in section (but not too much in class)

9/7/17

© 2004-2007 Ed Lazowska, Hank Levy, Andrea and Remzi Arpaci-Dusseau, Michael Swift

5

## Workload

- This class has a significant amount of work
  - 5-6 Programming **projects** (some individual, some group)
  - 6-7 homeworks to practice material before exams
  - Midterm, final
  - Dates are **not** flexible
- If you're going to drop this course
  - please do it soon!

6

## Programming

- All programming is in C
  - All operating systems (almost) are written in C
  - Most high-performance code is written in C
- You will get an opportunity to learn about
  - revision control for group projects
  - makefiles to automate compilation of larger programs
  - Debugging
- Most projects will be in pairs
- Example:

```
#include <stdio.h>
int l;int main(int o,char **O,
int I){char c,*D=O[1];if(o>0){
for(l=0;D[l]
++]-=10){D[l++]-=120;D[l]-=
110;while (!main(0,O,l))D[l]
+= 20; putchar((D[l]+1032)
/20 );}putchar(10);}else{
c=o+ (D[I]+82)%10-(I>1/2)*
(D[I-1+I]+72)/10-9;D[I]+=I<0?0
:!(o=main(c/10,O,I-1))*((c+999
)%10-(D[I]+92)%10);}return o;}
```

## Computers

- All programming projects will be graded by running them on a CSL workstation
  - It is fine to do the projects on your own machine
  - In general they can be done on MacOS or Windows (with CygWin) as well
  - **It is your responsibility to make sure your code works on a CSL machine before turning it in.**
- There are many computer labs on the 1<sup>st</sup> floor for your use
  - We will use Linux, so learn the basics if you haven't already

8

## Grades

- Exams: 40%
  - Midterm, non-cumulative final
- Programming: 45 %
- Homework: 20%

## Readings

- Textbook: **Operating Systems: Three Easy Pieces**
  - Readings will be assigned to cover material from lecture
  - You can do readings before or after lecture, based on your learning style
  - ... But most helpful before lecture
  - ... Very helpful before exams

## Honesty

- It is easy to cheat

## Course Content

- In this class we will learn:
  - what are the major components of most OS's?
  - how are the components structured?
  - what are the most important (common?) interfaces?
  - what policies are typically used in an OS?
  - what algorithms are used to implement policies?
- Philosophy
  - you may not ever build an OS
  - but as a computer scientist or computer engineer you need to understand the foundations
  - most importantly, operating systems exemplify the sorts of engineering design tradeoffs that you'll need to make throughout your careers – compromises among and within cost, performance, functionality, complexity, schedule ...

## What is an Operating System?

- An operating system (OS) is:
  - a software layer to abstract away and manage details of hardware resources
  - a set of utilities to simplify application development

- “all the code you didn’t write” in order to implement your application

## The OS and hardware

- An OS **mediates** programs’ access to hardware resources
  - Computation (CPU)
  - Volatile storage (memory) and persistent storage (disk, etc.)
  - Network communications (TCP/IP stacks, ethernet cards, etc.)
  - Input/output devices (keyboard, display, sound card, etc.)
- The OS **abstracts** hardware into **logical resources** and well-defined **interfaces** to those resources
  - processes (CPU, memory)
  - files (disk)
    - programs (sequences of instructions)
  - sockets (network)

## Why bother with an OS?

- Application benefits
  - programming **simplicity**
    - see high-level abstractions (files) instead of low-level hardware details (device registers)
    - abstractions are **reusable** across many programs
  - **portability** (across machine configurations or architectures)
    - device independence: 3Com card or Intel card?
- User benefits
  - **safety**
    - program “sees” own virtual machine, thinks it owns computer
    - OS **protects** programs from each other
    - OS **fairly multiplexes** resources across programs
  - **efficiency** (cost and speed)
    - **share** one computer across many users
    - **concurrent** execution of multiple programs

15

## What Functionality belongs in OS?

- No single right answer
  - Desired functionality depends on outside factors
  - OS must adapt to both user expectations and technology changes
    - Change abstractions provided to users
    - Change algorithms to implement those abstractions
    - Change low-level implementation to deal with hardware
- Current operating systems driven by evolution

16

## Major Themes in OS

- Virtualization
  - Taking physical hardware and making a software version that is sharable, easier to use, more powerful
  - Examples:
    - CPU: we can run two programs at the same time
    - Memory: programs see a linear range of addresses but underlying DRAM is shared in 4kb chunks
    - Disk: we use files/folders, disk internally has blocks
- Concurrency
  - Maintaining correctness when many things happen at once
  - Examples:
    - Code on 2 CPUs try to increment the same variable
- Persistence
  - Keep data safe across system crashes/reboots
